                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC The present invention relates to a transformant having been modified so CC as to produce a secondary metabolite. The secondary metabolite has a CC benzene ring skeleton free from substitution at the para-position by a CC nitrogen-containing functional group, thereby enabling the production of CC a secondary metabolite with a benzene ring skeleton substituted at the CC para-position by a nitrogen-containing group. The transformant organism CC of the present invention has been produced by transferring a gene CC participating in the biosynthesis pathway from chorismic acid into participating in the present sequence is the coding sequence for 4-aminophenylpyruvic acid. The present sequence is the coding sequence for CC aminophenylpyruvic acid synthase (paph), from Streptomyces CC venezuelae. paph participates in the biosynthesis pathway from chorismic CC acid into p-aminophenylpyruvic acid, and so the paph gene can be used to produce the transformant of the present invention. The transformant can be used to produce metabolites for application in pharmaceuticals, veterinary drugs and agrochemicals

                                                                                                                                   The present invention relates to transformants capable of producing PF1022 substance derivatives. These were obtained by transferring a participating in the biosynthesis pathway from chorismic acid to paminophenylpyruvic acid (biosynthesis gene) into a phenylalanine-requiring host derived from an organism producing the PF1022 substant The transformants are producing PF1022 substance derivatives by fermentation, for use as pharmaceuticals or veterinary drugs. The presentation is a substance PF1022 coding sequence from Streptomyces

```

The invention relates to a novel composition comprising a translation system comprising an orthogonal tRNA (O-ENA) and an orthogonal aninoacyl tRNA synthetase (O-RS), where the O-RS preferentially aminoacylates the O-ENA with at least one unnatural amino acid in the translation system and the O-ENA recognises at least one selector codon. A composition of the invention is useful for producing at least one protein comprising at least one unnatural amino acid. The protein is the Asp12TAG mutant of chloramphenical acetyltransferase (CAT), the Tyr163TAG mutant of mouse dihydrofolate reductase comprising CHOOH His6tag. The unnatural amino acid is provided exogenously. The translation system is a cell and the unnatural amino acid is biosynthesised by the cell. The present sequence represents a plasmid containing the individual genes papABC that encode the translation of chorismate to the unnatural amino acid p-aminophenylalanine (pAF)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel composition comprising a translation system comprising an orthogonal tRNA (O-tRNA) and an orthogonal aminoacyl tRNA synthetase (O-RS), where the O-RS preferentially aminoacylates the O-tRNA with at least one unnatural amino acid in the translation system and the O-tRNA recognises at least one selector codon. A composition of the invention is useful for producing at least one protein comprising at least one unnatural amino acid. The protein is the AsplZTAG mutant of chloramphenicol acetyltransferase (CAT), the Tyr163TAG mutant of mouse dihydrofolate reductase (DHFR), or a Tyr163TAG mutant of mouse dihydrofolate reductase comprising CHOOH His6tag. The unnatural amino acid is biosynthesised by the cell. The present sequence represents a plasmid for use in the biosynthesis of p-aminophenylalanine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition useful for producing plass translation system comprising
